

JurisBot Court-Tech R&D Documentation

Overview

This document consolidates the research and analysis developed in the conversation regarding court software used for conciliation, mediation, online dispute resolution (ODR), virtual hearings, and case management in India as of 2025-2026.[cite:9] [cite:16] [cite:39] [cite:41] [cite:44] The goal is to convert that discussion into practical R&D documentation for identifying SaaS and AI-product opportunities for a court-tech startup such as JurisBot.[cite:1] [cite:22] [cite:47]

The current court-tech landscape is not unified under one software system. Instead, it is split across e-Courts and CIS for core court administration, Virtual Courts for limited online adjudication categories, multiple video-conferencing tools for hearings, and separate ODR/ADR platforms such as Presolv360 and IDRC for mediation, conciliation, and related workflows.[cite:9] [cite:39] [cite:41] [cite:44] [cite:1] [cite:22] This fragmentation creates real operational, legal, and product gaps that remain unsolved in day-to-day practice.[cite:16] [cite:39]

Existing Platform Landscape

e-Courts and CIS

The e-Courts Mission Mode Project is the main public digital backbone for Indian courts and includes digital access services, case lifecycle support, and integration efforts across the judiciary.[cite:9] Public materials also show very large-scale digital usage, including video-conferenced hearings and broad mobile adoption of e-Courts services, which indicates strong institutional dependence on this ecosystem.[cite:9]

CIS functions as the operational case information layer inside courts, but public evidence emphasizes macro digitization and access more than deep automation of staff-heavy workflows such as defect detection, structured intake, notice generation, and intelligent case preparation.[cite:9] [cite:16] This suggests that digitization exists, but process intelligence is still limited.[cite:16]

Virtual Courts and Online Hearings

The Virtual Courts system is used for specific categories such as online adjudication of traffic challans and petty matters rather than as a complete unified hearing operating system for all court processes.[cite:41] [cite:44] Government material indicates that several video-conferencing tools have been used by courts, including platforms such as Vidyo, Jitsi Meet, Google Meet, Microsoft Teams, and Cisco WebEx, while BharatVC and NICMeet have also been explored for more standardized use.[cite:39]

This shows that virtual court operations remain fragmented across software layers: scheduling, hearing access, participant verification, recording, transcript creation, evidence display, and record archival are not visibly unified into one court-native operating system. [cite:16] [cite:39] [cite:41]

ODR, Mediation, and Conciliation Platforms

Private and institutional ADR systems such as Presolv360 and IDRC provide online dispute resolution features including case management, scheduling, secure communication, hearing support, and digital process handling for mediation, conciliation, and arbitration.[cite:1] [cite:22] [cite:47] These platforms are real market participants and show that ADR digitization is active, but their public feature sets still appear more platform-level than deeply workflow-specialized for court-linked mediation and conciliator-heavy processes.[cite:1] [cite:22] [cite:47]

The mediation ecosystem also remains comparatively under-scaled in court referral terms, while private mediation offers speed and privacy advantages over ordinary court proceedings.[cite:45] That creates a strong business case for workflow tools that improve referral conversion, scheduling reliability, settlement throughput, and institutional reporting. [cite:45] [cite:1] [cite:22]

Core Drawbacks and Pain Points

1. Fragmented Hearing Infrastructure

Courts do not operate through one standardized platform for online hearings. Multiple third-party and government-linked systems are used, which creates inconsistency in security, onboarding, training, user experience, and audit quality.[cite:39] [cite:16]

- **Who faces it:** Judges, lawyers, litigants, and court staff.[cite:16] [cite:39]
- **Current workaround:** Staff and lawyers manually coordinate links, schedules, and hearing-room controls across whichever platform is available.[cite:39]
- **Business/legal impact:** More adjournment risk, fragmented records, inconsistent security posture, and higher institutional friction.[cite:16] [cite:39]
- **Suggested enhancement:** A court-grade orchestration layer for verified joins, role-based controls, document display, hearing minutes, transcript generation, and record synchronization.
- **JurisBot fit:** JurisBot can act as a workflow and intelligence layer above existing video engines without needing to replace them initially.[cite:39] [cite:16]

2. Security and Trust Deficits in Virtual Hearings

A parliamentary committee highlighted the security risks of third-party software and recommended an indigenous software approach for virtual hearings.[cite:16] Government material also reflects ongoing concern with secure connectivity and authentication.[cite:39]

- **Who faces it:** Judges, IT teams, registries, public-sector buyers, litigants.[cite:16] [cite:39]

- **Current workaround:** Restricted access links, passwords, staff vetting, and fragmented controls.[cite:39]
- **Business/legal impact:** Public-sector procurement resistance, confidentiality risk, chain-of-custody concerns, and reluctance to expand use-cases.[cite:16] [cite:39]
- **Suggested enhancement:** eKYC, eSign, role-based access control, secure India-hosted storage, watermarking, privileged document labels, and immutable audit trails.
- **JurisBot fit:** JurisBot can differentiate through security-first architecture and compliance-oriented workflow logging.

3. Infrastructure and Digital Divide Problems

The committee observed that many advocates and litigants still lack adequate infrastructure and high-speed internet access for virtual hearings, and subordinate courts have faced adaptation issues.[cite:16] This is one of the biggest real-world adoption constraints in Indian court tech.[cite:16]

- **Who faces it:** Litigants, smaller advocates, subordinate courts, support staff.[cite:16]
- **Current workaround:** Adjournments, staff help, shared devices, or fallback to physical appearance.[cite:16]
- **Business/legal impact:** Unequal access to justice, lower digital participation, and failed hearing efficiency gains.[cite:16]
- **Suggested enhancement:** Low-bandwidth hearing modes, assisted join flows, mobile-first design, vernacular support, and readiness checks.
- **JurisBot fit:** JurisBot can provide a litigant access shell with guided steps, multilingual support, and staff-assisted onboarding.

4. Weak Evidence Handling During Online Hearings

Public descriptions of court and hearing systems do not indicate a mature, unified evidence-room experience with issue-linked exhibits, synchronized bundle navigation, annotation, and instant retrieval during live proceedings.[cite:41] [cite:44] [cite:39] At the same time, the committee explicitly recommended AI support for large-scale document handling, which implies that current workflows remain painful.[cite:16]

- **Who faces it:** Judges, lawyers, court staff.
- **Current workaround:** Manual PDF bundles, separate notes, email-based sharing, and screen-sharing during hearings.
- **Business/legal impact:** Hearing delay, exhibit confusion, duplicate preparation effort, and weaker digital audit quality.
- **Suggested enhancement:** AI document room with chronology extraction, issue-based tagging, contradiction detection, exhibit indexing, and in-hearing retrieval.
- **JurisBot fit:** This is one of the strongest MVP opportunities for JurisBot because it directly solves a repeated, high-friction task.[cite:16]

5. Limited Automation in Case Management

Although e-Courts has achieved wide operational scale, the committee still recommended digitising manual processes such as filing of complaints and issuance of summons in hybrid systems, which shows that critical manual work remains.[cite:16] [cite:9] Public-facing system descriptions do not indicate deep automation for intake validation, routing, defect prediction, or registry intelligence.[cite:9] [cite:16]

- **Who faces it:** Registry staff, clerks, lawyers, litigants.
- **Current workaround:** Manual scrutiny, repeated corrections, re-entry, spreadsheets, and template-driven paperwork.
- **Business/legal impact:** Registry bottlenecks, higher staff burden, delayed movement of cases, and user frustration.
- **Suggested enhancement:** OCR-based extraction, structured filing intake, defect prediction, automated notice generation, and workflow queues.
- **JurisBot fit:** JurisBot can become a registry automation and filing-quality assistant for courts, tribunals, and ADR institutions.

6. Mediation and Conciliation Workflow Gaps

ODR platforms such as Presolv360 and IDRC support secure case management, scheduling, status tracking, and virtual hearings, but public evidence does not show a deeply integrated workflow for referral intake, consent collection, caucus management, settlement drafting, and return-to-court reporting in one tightly managed system.[cite:1] [cite:22] [cite:47] This is especially important in court-linked mediation and institutional ADR settings.[cite:45]

- **Who faces it:** Mediators, conciliators, litigants, lawyers, mediation center staff, judges receiving settlement outcomes.[cite:45] [cite:1] [cite:22]
- **Current workaround:** Email, spreadsheets, phone coordination, templates, and manual status updates.
- **Business/legal impact:** Lower settlement throughput, more no-shows, slower closure, weak audit trails, and poor scalability.
- **Suggested enhancement:** End-to-end mediation workspace with referral intake, issue capture, caucus controls, draft generation, clause libraries, and court-ready outcome packages.
- **JurisBot fit:** JurisBot can become a mediation operating system rather than only a meeting platform.[cite:1] [cite:22] [cite:47]

7. Weak Private Session and Negotiation Tooling

IDRC publicly emphasizes secure virtual ADR hearings and participant support, while Presolv360 emphasizes digital case management and communications, but public descriptions do not show strong tooling for structured negotiation-state tracking, confidential caucus notes, settlement-variable modeling, or AI-assisted mediator support.[cite:22] [cite:1] [cite:47]

- **Who faces it:** Mediators, conciliators, lawyers, enterprise dispute teams.
- **Current workaround:** Separate notes, private chats, offline drafting, and spreadsheet tracking.
- **Business/legal impact:** Lower settlement quality, confidentiality risks, missed solution paths, and poor institutional memory.
- **Suggested enhancement:** AI-assisted caucus notebook, confidential issue matrix, offer comparison, clause suggestions, and negotiation progress tracking.
- **JurisBot fit:** High fit, especially in repeatable dispute environments like recoveries, platform disputes, and commercial settlements.

8. Scheduling and Coordination Friction

Scheduling in courts and ADR is not only about selecting a time slot. It also requires participant confirmation, interpreter needs, device readiness, notice acknowledgment, and case preparedness, none of which appears strongly handled in public descriptions of current systems.[cite:22] [cite:41] [cite:39]

- **Who faces it:** Court staff, lawyers, litigants, mediators.
- **Current workaround:** Calls, emails, manual notices, repeated rescheduling.
- **Business/legal impact:** No-shows, underutilized sessions, adjournments, and staff overload.
- **Suggested enhancement:** Smart scheduling with readiness checks, device tests, interpreter coordination, reminders, and structured reschedule logic.
- **JurisBot fit:** Very strong MVP potential due to clear ROI and relatively fast implementation.

9. Multilingual, Accessibility, and Plain-Language Gaps

The digital divide observed by the committee is not only technical; it also reflects language and usability barriers for ordinary litigants.[cite:16] Public materials for Virtual Courts and ODR systems do not prominently show strong multilingual, accessibility-first, or plain-language guidance layers across the full workflow.[cite:41] [cite:1] [cite:22]

- **Who faces it:** Litigants, self-represented parties, persons with disabilities, rural users.
- **Current workaround:** Dependence on lawyers, staff, or informal interpretation.
- **Business/legal impact:** Higher drop-off, procedural errors, and unequal participation.
- **Suggested enhancement:** AI translation, speech-to-text, text-to-speech, guided form completion, disability-aware UX, and simplified legal notices.
- **JurisBot fit:** Strong differentiator, especially for India's multilingual legal services market.

10. Analytics and Decision-Support Deficiency

Public e-Courts material highlights scale and adoption, but it does not visibly provide rich role-based operational analytics on adjournment causes, readiness, document risk, settlement propensity, or process bottlenecks.[cite:9] This limits managerial intelligence for courts and ADR institutions.[cite:9][cite:41]

- **Who faces it:** Judges, court administrators, mediation centers, enterprise legal teams.
- **Current workaround:** Manual MIS reports, exports, spreadsheets, and anecdotal tracking.
- **Business/legal impact:** Poor resource allocation, hidden workflow inefficiencies, and weaker policy decisions.
- **Suggested enhancement:** Operational dashboards, bottleneck tracking, settlement funnel analysis, stage-aging reports, and hearing readiness scores.
- **JurisBot fit:** Strong SaaS opportunity, especially outside core courts in private ADR and institutional dispute programs.

Manual Processes That Still Exist

The available evidence indicates that many manual or semi-manual processes remain active in real-world court and ADR operations.[cite:16][cite:39][cite:45] These are strong automation targets for an R&D roadmap.

Manual process	Current state	Automation opportunity
Filing scrutiny	Manual defect checking and corrections continue in practice.[cite:16]	OCR extraction, defect prediction, structured filing validation
Summons / notice issuance	Still identified for further digitisation. [cite:16]	Template automation, trigger-based issuance, tracking
Hearing coordination	Often handled through calls, emails, and staff mediation.[cite:39]	Smart scheduling, readiness workflows, automated reminders
Exhibit bundle preparation	Commonly prepared manually by lawyers and staff.	AI indexing, chronology generation, issue-based bundles
Mediation intake and referral	Often fragmented across channels.[cite:45][cite:1]	Unified intake, consent capture, workflow routing
Settlement drafting	Frequently done through templates and manual drafting.	AI clause suggestions, settlement builder, red-flag detection
Status reporting	Often maintained in spreadsheets or manual MIS.	Live dashboards and analytics layers

Stakeholder-Specific Problem Map

Judges

Judges face document overload, fragmented hearing tools, inconsistent digital records, and limited operational intelligence during online proceedings.[cite:16][cite:39] The absence of an integrated case-intelligence layer increases cognitive load and reduces hearing efficiency.[cite:16]

Lawyers

Lawyers face repeated bundle preparation, fragmented hearing links, coordination burdens, inconsistent virtual-hearing UX, and duplicated work across filing, hearing, and mediation systems.[cite:39][cite:22] This creates a direct willingness-to-pay opportunity for hearing-prep and matter-intelligence tools.

Litigants

Litigants face the hardest access problems: digital literacy barriers, infrastructure gaps, language friction, and poor procedural clarity in remote systems.[cite:16][cite:41] These users need guided, low-friction interfaces rather than court-style portals alone.[cite:16]

Court Staff and Registry Teams

Court staff continue to handle scrutiny, coordination, notices, scheduling, and record maintenance with limited deep automation.[cite:16] Their pain points are highly operational and measurable, making them suitable for workflow SaaS and AI-assist products.

Mediators and Conciliators

Mediators and conciliators need better tools for private sessions, confidential note control, structured negotiation support, settlement drafting, and outcome analytics.[cite:22][cite:1][cite:47] Current public platform descriptions suggest that these needs are only partially served.[cite:22][cite:1]

Product Opportunities for JurisBot

The best opportunities are modular products that sit above or beside the existing digital stack, rather than trying to replace the judiciary's full core infrastructure immediately.[cite:9][cite:39][cite:16] This creates a more practical startup path and a more realistic go-to-market strategy.[cite:1][cite:22]

Opportunity 1: AI Case Intelligence Workspace

An AI case workspace can ingest bundles, create chronologies, extract issues, identify contradictions, surface authorities, and support live hearing navigation.[cite:16] This directly addresses judge and lawyer pain in document-heavy matters.[cite:16]

Opportunity 2: Mediation Operating System

A mediation OS can manage referrals, onboarding, caucus rooms, confidential notes, settlement templates, eSign flow, and institutional reporting.[cite:1] [cite:22] [cite:47] This is a high-value area because current public solutions appear broad but not deeply specialized. [cite:1] [cite:22]

Opportunity 3: Virtual Hearing Operations Layer

A hearing-ops layer can add participant verification, hearing readiness checks, secure document presentation, transcript generation, and post-hearing action summaries on top of existing video engines.[cite:39] [cite:16] This avoids the complexity of replacing the core video platform at the MVP stage.[cite:39]

Opportunity 4: Registry and Filing Automation

A filing-assist product can reduce scrutiny load through intelligent intake, defect detection, auto-categorization, and document extraction.[cite:16] This is valuable in both public-sector courts and private tribunals or ADR institutions.[cite:16]

Opportunity 5: Litigant Access and Guidance Layer

A guided assistant for litigants can provide multilingual notices, procedural explanations, voice guidance, reminders, and assisted joins for hearings or mediation sessions.[cite:16] [cite:41] This solves one of the largest adoption problems in remote justice workflows.[cite:16]

Prioritized Ranking for Startup Use

The following ranking reflects severity, recurrence, market demand, ease of solving with software/AI, MVP feasibility, and revenue potential.

Rank	Opportunity / problem area	Severity	Frequency	Market demand	Ease with AI/software	MVP potential	Revenue opportunity
1	AI case intelligence for document-heavy matters	9	9	9	8	9	9
2	Mediation and conciliation operating system	9	8	9	8	8	9
3	Virtual hearing orchestration layer	9	8	8	7	8	8
4	Registry and filing automation	8	9	8	8	8	8

Rank	Opportunity / problem area	Severity	Frequency	Market demand	Ease with AI/software	MVP potential	Revenue opportunity
5	Scheduling and readiness automation	8	9	8	9	9	7
6	Multilingual litigant assistance	8	8	8	8	8	7
7	Analytics and institutional dashboards	7	8	8	8	8	8
8	Security and compliance overlay	9	7	9	6	6	8

R&D Direction

The most practical R&D direction for JurisBot is to begin with workflow layers that integrate into the existing ecosystem rather than compete directly with the judiciary's core platforms. [cite:9] [cite:39] A staged startup roadmap would begin with private-sector ADR centers, law firms, enterprise disputes, and institutional mediation programs because these buyers move faster than public-sector court procurement while suffering from many of the same workflow problems.[cite:1] [cite:22] [cite:47]

A practical sequence is:

1. Build an AI case intelligence MVP for hearing preparation and document navigation. [cite:16]
2. Expand into a mediation operating system with settlement drafting and caucus controls. [cite:1] [cite:22] [cite:47]
3. Add a virtual hearing operations layer for transcript, readiness, and evidence presentation.[cite:39] [cite:16]
4. Later pursue court-side integrations for registry automation, dashboards, and institutional deployments.[cite:9] [cite:16]

Final Assessment

The research indicates that the Indian court-tech and ADR software market in 2026 is active but structurally fragmented.[cite:9] [cite:39] [cite:41] [cite:1] [cite:22] The largest real-world gaps are not generic digitization gaps, but workflow intelligence gaps around hearing operations, document-heavy adjudication, mediation orchestration, access support, and analytics.[cite:16] [cite:39] [cite:45]

These gaps are commercially meaningful because they affect repeated daily operations, involve measurable inefficiencies, and can be addressed with modular AI-enabled SaaS products that sit above current systems.[cite:16] [cite:1] [cite:22] [cite:47] JurisBot has the

strongest startup potential where it reduces repeated operational friction without requiring full replacement of legacy court infrastructure.[cite:9][cite:39][cite:16]
